

DOC VERSION v2.4 - JANUARY 2017

# **Contents**

ntroduction	3
ntegrating and configuring skybox	3
ditor properties	3
ccess From Scripts	4
ay-night cycle	5
un & Moon positioning	7
pgrading	9
older location	9
hangelog	10

## Introduction

Thank you for purchasing the *Farland Skies - Low Poly* skybox! We hope you enjoy using the product and that it makes your game development project a success.

If you have questions, please do not hesitate to contact us at <u>support@borodar.com</u>, we will be glad to help you out.

Also, when you have a spare moment, please <u>leave</u> us a review on the Asset Store.

## Integrating and configuring skybox

It's pretty easy to integrate skybox to your scene. All you need to do it's just drag the **SkyboxController** prefab to the hierarchy window.

Skybox will be assigned automatically for this scene and now you can use *SkyboxController* to manage its settings, either from scripts or directly in the editor.

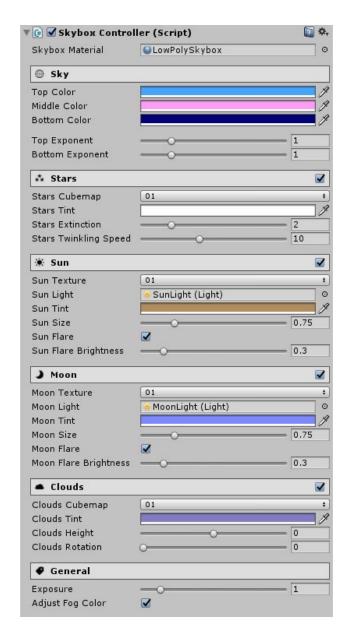

## **Editor properties**

### Sky

This section allows you to customize basic sky gradient with three color values: at the top pole, on the equator, and at the bottom pole. *Top/Bottom Exponent* sliders can be used to adjust linear interpolation between corresponding pole and equator.

#### Stars

Here you can configure stars tint, extinction, and twinkling speed. *Stars extinction* is a reduction in stars apparent brightness closer to the horizon. *Stars twinkling* is a variation in stars apparent brightness caused by the atmospheric turbulence.

### Sun & Moon

In this section, you can customize soon and moon appearance. All settings are straightforward, except *flare brightness*. Actual flare brightness depends on correspondent tint alpha, and this property is just a coefficient for that value.

### **Clouds**

This section allows you to customize clouds colors and positioning.

### General

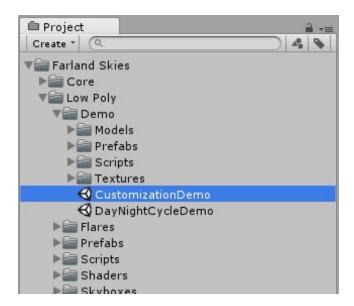

In general section, you can adjust exposure for the whole sky. Also, there is a checkbox that allows you to keep fog color in sync with the sky middle color automatically.

## **Access From Scripts**

**SkyboxController** implements the "singleton" pattern, so you can easily access all its properties from anywhere in your scripts:

```
SkyboxController.Instance.MiddleColor = Color.blue;
SkyboxController.Instance.TopExponent = 0.75f;
SkyboxController.Instance.Rotation += 1f;
```

Please take a look at the *CustomizationDemo* scene to get more details.

## Day-night cycle

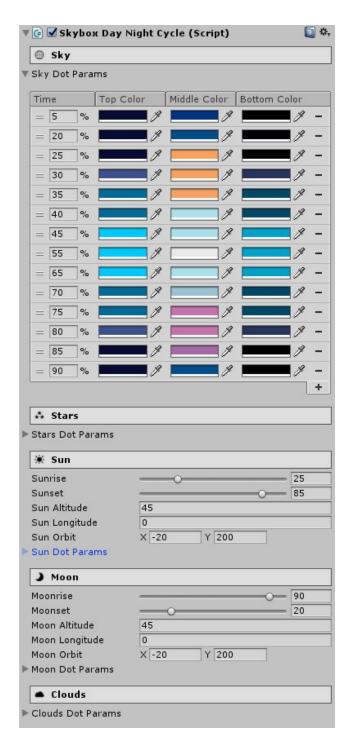

This package comes with a handy script to manage skybox day-night cycle.

At first, you need to drag the **SkyboxDayNightCycle** prefab somewhere to your scene.

Then adjust prefab properties to fit your needs:

- Sky DoT Params is a list of sky colors, based on time of day. Each list item contains one "time" filed that should be specified in percents (0-100). Also, there are three "color" fields, corresponding to the skybox color settings with the same names.
- Stars DoT Params list allows you manage stars tint color over time. It works in the same way just specify a time in percents and tint color for each element.
- **Sun & Moon DoT Params** are for configuring sun & moon appearance and light params depending on time. Use the same approach as above for setting it up.
- *Clouds Dot Params* list allows you manage clouds tint color over time. It works in the same way as above.

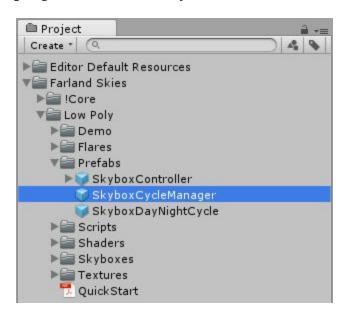

**SkyboxDayNightCycle** script will automatically interpolate values between list items and update skybox parameters depending on its **TimeOfDay** property.

However, *SkyboxDayNightCycle* doesn't run through day-night cycle automatically. It requires few lines of code by yourself, but in this way you can fully control your animation cycle duration, make your time flow non-linear, etc.

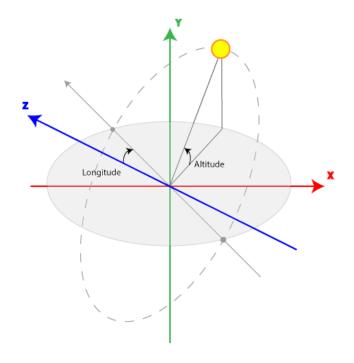

The simplest example to do so:

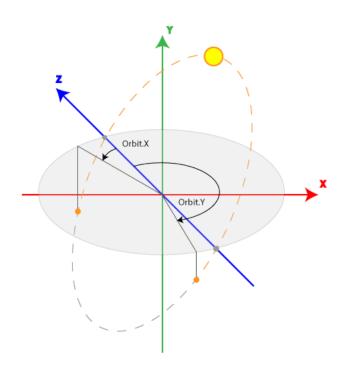

If you don't want to bother with scripts by yourself, then you can just grab **SkyboxCycleManager** prefab and add it to your scene. It will manage animation cycle progress automatically.

# **Sun & Moon positioning**

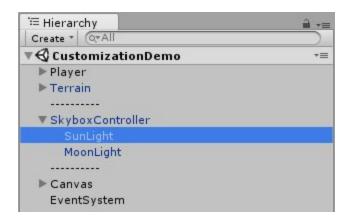

Sun & Moon position settings may seem a bit confusing at first look, so let's try to explain it visually:

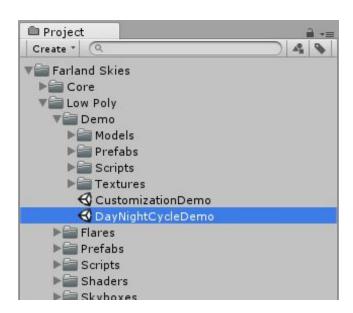

- **Sun Altitude** is the *max* angle between the horizon and the center of sun's disk.
- **Sun Longitude** is the angle between *z-axis* and the center of sun's disk *at sunrise*.
- Sun Orbit is a pair of angles that limit visible orbit of the sun.

Also, You can change sun and moon positions just by rotating corresponding direction light objects, under *SkyboxController* object.

Please take a look at the *DayNightCycleDemo* scene to get more details.

## **Upgrading**

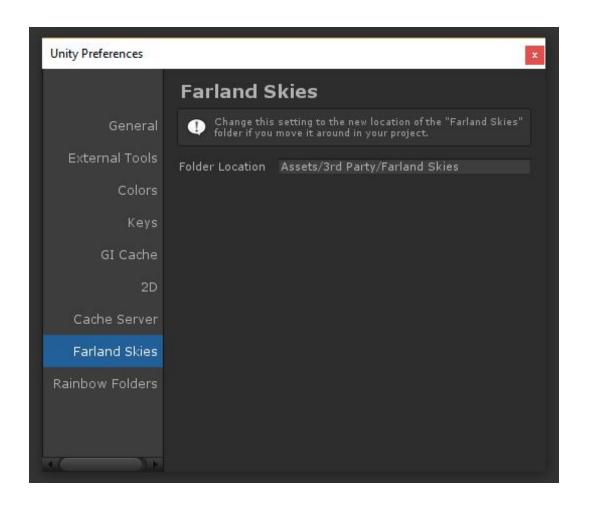

Please always do a clean import of the *Farland Skies - Low Poly* (delete the old version before importing the new one), otherwise you may receive a number of difficult to diagnose issues.

- Delete the *Assets/.../Farland Skies* folder
- Delete the *Assets/Editor Default Resources/Farland Skies* folder, if exists
- Import the new version from the Asset Store

## Folder location

The *Farland Skies* folder is movable and doesn't require to be in the root of your assets folder.

You can freely move it wherever you want (to some "3rd Party" folder, for example). Then just go to  $Edit \rightarrow Preferences \rightarrow Farland Skies$  and update the folder location:

# Changelog

### v 2.4

- Added option to move "Rainbow Folders" wherever you want in your project
- Got rid of the "Editor Default Resources" folder
- A number of small optimizations and fixes

### v 2.3

- Implemented possibility to enable/disable clouds, stars, sun or moon as shader feature
- Added three different types of clouds
- Added three different types of stars
- Added five different types of sun
- Added five different types of moon
- Various optimizations and fixes

### v 2.1

- Custom editor for skybox controller
- Custom editor for skybox day-night cycle script
- A number of small optimizations and fixes

#### v2.0

- Completely new single-pass shader
- Added procedural sun and moon
- Various optimizations and fixes

### v 1.1

- Added stars
- Various performance improvements

### v 1.0

Initial release
